

# Alfido Tech — Traffic Analysis:

## Key Insights & Action Items

Source: `traffic.pdf` (226,267 clean events, Aug 19–25, 2021). Full analysis, code, and charts: `Alfido_Tech_Traffic_Analysis.ipynb`.

### What this data is

The log is a **smart-link / landing-page click log** — each `linkid` is one shareable landing page, and every row is a visitor `event` : `pageview` (page loaded), `preview` (audio preview played), or `click` (clicked through to a streaming platform), tagged with date, country and city. There's no session ID, referrer, or timestamp-with-time in the export, so a few metrics below are best-available proxies rather than exact figures — flagged where relevant.

### Headline numbers

| Metric                                           | Value                          |
|--------------------------------------------------|--------------------------------|
| Total events                                     | 226,267                        |
| Date range                                       | Aug 19 – Aug 25, 2021 (7 days) |
| Pageviews / Previews / Clicks                    | 142,006 / 28,530 / 55,731      |
| Unique countries / cities                        | 211 / 11,993                   |
| Unique landing pages                             | 743                            |
| <b>Overall pageview → click conversion (CTR)</b> | <b>39.2%</b>                   |
| Aggregate non-conversion ("bounce") rate*        | 60.8%                          |

\*Proxy: share of pageviews without a matching click, computed in aggregate (no session ID to pair individual visits). True session duration isn't computable – the source has no time-of-day field.

## Key insights

1. **Conversion is solid (39.2%) but the majority of visitors still don't convert.** Roughly 3 in 5 pageviews don't lead to a click.

2. **Traffic volume and conversion quality don't line up.** Saudi Arabia and India bring the most pageviews but convert below average (32.9% and 42.5% CTR); Pakistan (51.5%), the US (45.7%) and India convert best among the top-10 markets. Turkey (26.6%) and UAE (32.8%) have real volume but the weakest CTR.
3. **Traffic is concentrated in a small number of pages/tracks.** One track alone drives roughly 18% of all events — a handful of high-traffic pages will move the aggregate metrics far more than catalog-wide tweaks.
4. **Some high-traffic pages convert well below average,** e.g. pages with 500+ pageviews converting at ~22–28% versus the 39% overall average — a clear, high-ROI fix list.
5. **Daily volume declined ~15% from day 1 to mid-week while CTR stayed flat** — a reach/promotion issue, not an on-page conversion issue, over the week measured.

## Five recommendations

1. **Fix the worst-converting high-traffic pages first.**  
Pages with  $\geq 200$  pageviews and CTR well under the 39% average (e.g. 21.8%, 26.1%, 26.9% in the notebook's ranked list) are the best-ROI redesign targets — test CTA wording,

platform-button order, and preview placement there before anywhere else.

2. **Reallocate spend toward markets that convert, and diagnose the ones that don't.** Grow reach in Pakistan/US/India (best CTR); investigate Turkey and UAE specifically — check localization, and whether the platforms shown first are actually available/preferred in that region.
3. **Add session ID, referrer/UTM, and a real timestamp to the tracking.** This is a prerequisite for real bounce-rate, session-duration, and channel-attribution numbers — today's figures are aggregate proxies.
4. **Investigate the low preview usage (12.6% of events).** If it's meant to aid conversion, make it more prominent; if it isn't helping, test removing it on the pages where it's used least, to see whether a shorter funnel converts better.
5. **Put high-traffic pages on a recurring re-promotion cadence.** Since CTR holds steady but volume decays day over day, scheduled re-shares/boosts on the top pages should flatten the decline seen this week.

*For per-country and per-page tables, the full funnel chart, and daily trend visuals, see the notebook.*
